 - Programmers and Analyst Programmers 19
 - The project manager 20
 - The IT relationship manager 20
 - The architect 20
- G. Technology and skills clusters 21**
 - Software layers 21
 - The computer processor (hardware) 22

The operating system: open and closed	22
Application software.....	23
Programming tools and languages	23
Database software	23
The importance of skills clusters.....	23
Some common skills clusters	24
Wintel cluster (MS Windows running on Intel machines)	24
Open systems (UNIX/Linux) skills cluster.....	24
IBM mainframe skills cluster	25
HP NonStop skills cluster	25
Sun/Fujitsu SPARC skills cluster	26
IBM System p midrange skills cluster	26
IBM i operating system (a.k.a. AS/400) midrange skills cluster.....	27
SAP R/3 (a.k.a. SAP ERP) skills cluster	27
Apple mobile (iOS) skills cluster	28
Android mobile skills cluster	28
H. Glossary (A to Z)	29
FEATURE: Big Data – what is it? Why is it different from ‘normal’ data?	32
FEATURE: CMM – the Capability Maturity Model	34
FEATURE: Microsoft certification.....	47
FEATURE: Mobile App development and support	48
FEATURE: Online book services for IT people	50
FEATURE: Professional associations for IT people	53
FEATURE: Women in IT	64

A. About this guide

HR people and others entering the IT function for the first time have lots of questions. Some are quite basic:

'What do all these different people actually do?'

'What is ITIL [or the SDLC etc. etc.]?'

'Why are there so many specialists who can't do each others' jobs?'

Others are puzzled by more in-depth technical terms and their relevance to practical people management decisions:

'Do we really have to recruit SAP experts when we introduce SAP: can't our existing analyst programmers quickly retrain?'

'How does an OpenView expert differ from a Tivoli expert when someone I've just talked to insists they do the same things?'

'Should I be impressed by someone who's MCSE certified?'

'What are Function Points and why does one of our IT managers say they can help us improve programmer productivity?'

This guide outlines the essential facts about IT functions and their people and organizational arrangements, and the 'people' issues that arise within them. And, as the second set of sample questions above suggests, the guide also includes proprietary terms and specialized technical terms – *where these are relevant to people or skills issues.*

The guide will be useful to those entering the IT arena for the first time (whether they are IT HR people or even IT trainees) AND to those who have been around IT for years. No other publication explains IT terminology from a people, skills and organization point of view.

The guide starts with an introduction to the IT function (how it is structured, the processes and the roles generally found within it, some technical facets) as this general content is best conveyed in narrative form and sits less comfortably in glossary form.

The glossary that follows includes:

- Technical terms that tend to appear in job descriptions, job ads, etc. with a short definition and most importantly some comments on their relevance to people and skills issues (see below), and
- Terms relating to the organization and management of IT.

HR terms that are in general use and technical terms that have little relevance to people or skills are omitted.

'No other publication explains IT terminology from a people, skills and organization point of view.'

The Glossary:

Technical term is defined ... before discussing its **relevance to people**

CSS: Cascading Style Sheets is a way of defining the look and appearance of a web page. Knowledge of CSS is necessary mostly in web developer jobs. It is not, on its own, enough to guarantee employability but is a very useful and often essential secondary skill set.

CTO or Chief Technology Officer: a somewhat variable term that can mean one of four types of job: (1) the person who looks after the technical infrastructure as opposed to the applications that run on that infrastructure (2) what others might call the **CIO** or IT Director (3) the role – wider than just IT – that heads up all technical functions in a technology-based company such as a telecoms company, where a CTO might also oversee the telecoms network (4) the product design head in a technology vendor.

CVS: Concurrent Versions System, an **open source** facility for controlling the many versions of software that are developed in the course of a software development project. Relevant to **application developers and programmers** and hence often specified in job ads, but is usually a 'nice to have' rather than an essential.
